

## Shapes of Molecules

- 1)  $O_2, H_2$  etc. (two atoms) → linear shaped, e.g.)  $BeCl_2$   
 $BeCl_2$

- 2) Three atoms v-shaped, e.g.)  $H_2O$   $H_2O$  – V shaped

- 3) Four atoms (central atom + three bonded atoms)

- 4) Four atoms (central atom above other three)

- 5) Five atoms (four atoms bonded to central atom)

Electron pair repulsion theory → electron pairs in outer shell of the central atom repel each other and end up as far apart as possible

No. of Electron Pairs	e.g.	Arrangement	Bond Angle	Shape
2	$BeH_2$	Linear	$180^\circ$	Linear =

## Experiment: Recrystallisation and Melting Point of Benzoic Acid

- A) Find pure sample → recrystallisation (separated solid from solid impurities)
- 1) Measure 1g benzoic acid and place in beaker. Add 10 cm<sup>3</sup> of water and add (minimum amount of water)
  - 2) Place over B.B. and stir until dissolved
  - 3) Heat Büchner funnel by holding by stem and immersing it in boiling water (prevents crystallisation of benzoic acid while filtering)
  - 4) Set up Büchner flask and funnel, and place filter papers in funnel. Turn on water to operate suction pump.
  - 5) Pour solution through filter paper and collect filtrate in flask.
  - 6) Allow crystals to recrystallise
- B) Melting Point → temperatures between C° when melting begins and C° when entire solid has liquefied (melting point of impure is lower and wider than pure substance)

- 1) Seal end of capillary tube by holding over Bunsen B and rotating
- 2) Place benzoic crystal in tube, and place tube in melting point block on hot plate
- 3) Place thermometer in block and record melting point  
→ when turns colourless = (120°C)

\* Low melting point → covalent molecule crystals

$$\% \text{ purified e.g.)} \quad 2.4\text{g} + 2.1\text{g pure} \quad \frac{2.1}{2.4} \times 100 = 87.5\%$$

- \* Important to use minimum water → saturated solution.
- \* Use of benzoic acid → food preserve

Trends	Across	Down
1) Atomic Radius	<p><b>Decreases</b></p> <ul style="list-style-type: none"> <li>* <u>increasing nuclear charge</u></li> <li>→ greater attractive forces attract shells closer to nucleus</li> <li>→ atomic radius decreases</li> <li>* <u>no increase in screening effect</u></li> <li>→ no additional shells added to counteract increasing + forces of nucleus</li> </ul>	<p><b>Increases</b></p> <ul style="list-style-type: none"> <li>* <u>extra shell</u></li> <li>* <u>screening effect of inner electron</u></li> <li>→ inner shells shield outer electron from positive charge of nucleus</li> </ul>
2) Ionisation Energy	<p><b>Increases</b></p> <ul style="list-style-type: none"> <li>* <u>decreasing atomic radius</u></li> <li>→ increased attraction between electron and nucleus → difficult</li> <li>* <u>increasing nuclear charge</u></li> <li>→ attraction between nucleus and outermost electrons increasing</li> <li>→ requires more energy</li> </ul>	<p><b>Decreases</b></p> <ul style="list-style-type: none"> <li>* <u>increasing atomic radius</u></li> <li>→ easier to remove electron</li> <li>* <u>screening effect</u></li> <li>→ shielded from positive forces</li> </ul>
3) Electronegativity	<p><b>Increases</b></p> <ul style="list-style-type: none"> <li>* <u>decreasing atomic radius</u></li> <li>→ greater attraction between electrons</li> <li>* <u>increasing nuclear charge</u></li> <li>→ electrons more strongly attracted to the nucleus</li> </ul>	<p><b>Decreases</b></p> <ul style="list-style-type: none"> <li>* <u>increasing atomic radius</u></li> <li>→ smaller attraction between a shared pair of electrons</li> <li>* <u>screening effect</u></li> <li>→ attraction of nucleus for these electrons decreases</li> </ul>
